Introduction
The Yellowbrick hybrid cloud data warehouse is designed to make migrating from Netezza fast and simple.

From a system perspective, the Yellowbrick hybrid cloud data warehouse:
> Is an integrated software and hardware system that installs in your data center easily, as a small rack-mount instance
> Offers capacity points similar to Netezza, with options from small 32TB appliances to large systems approaching 1PB of raw storage and more than 500 CPU cores
> Has enterprise integrations similar to Netezza for LDAP, SNMP, and syslog, as well as a similar security model

From the database software perspective, the picture is similarly compelling. The Yellowbrick system:
> Uses the same underlying PostgreSQL dialect as Netezza
> Supports PL/pgSQL stored procedures
> Has a library of functions added for Netezza compatibility
> Has intuitive syntax like Netezza (for example, nzload is ybload and nzsql is ybsql)
> Offers a similar set of ecosystem integrations via standard ODBC, JDBC, and ADO drivers
> Is certified and supported by many of the same enterprise tools you use today, such as Tableau, Microstrategy, and Informatica

A Yellowbrick solutions architect will help you scope and plan your migration as part of a proof of concept (POC). Once your POC is complete, your solutions architect will help you migrate your schema, data, application logic, ecosystem tools, and users to the Yellowbrick platform. You’ll have a production-ready system installed and running in under a day and will complete your migration within days or weeks. Your post-migration activities are similarly easy: your team will have very little tuning and configuration, will not have to pay for training and certification for a new system, and can get back to day-to-day business quickly.

What’s more, Yellowbrick has improved on Netezza in many areas. Its hybrid cloud data warehouse offers superior concurrent and mixed workload support so your apps and databases will run at top speed. Database administration is also much easier: you will not need to groom or vacuum tables, and statistics are automatically gathered and kept up to date. Yellowbrick hybrid cloud data warehouse systems are also easy to grow. You can scale compute and storage capacity incrementally by adding more blades to the system, up to nearly 1PB of raw storage. This makes sizing your environment more about determining your initial storage needs than estimating what you need five years from now.

This document provides an overview of migration tasks so you can see how easy it is to migrate to a Yellowbrick hybrid cloud data warehouse and serves as a guide for further streamlining the process.

Same-day installation and deployment
Yellowbrick hybrid cloud data warehouse systems can be deployed in less than two hours and be production-ready on day one. Their flash-based architecture means no moving parts to fail during transport. A Yellowbrick solutions architect will be onsite to install the system for you. Because the Yellowbrick hybrid data warehouse delivers up to 1.2PB of user storage in a 6-10U appliance that fits in a standard rack, you can expect to reclaim racks of space in your data center to save money.
A simple database migration
The Yellowbrick hybrid cloud data warehouse supports organizing your data into databases and schemas, just like Netezza and every other PostgreSQL-inspired database. This means you do not have to worry about the migration breaking your applications. You can continue to maintain your database organization as you always have, with one database per tenant. If you want to expand to multiple schemas in a single database, you can do so easily.

The Yellowbrick hybrid cloud data warehouse includes a query history database that is installed and fully documented. Your queries will be logged and optimized on day one, and you no longer have to endure dumps of in-memory query history or manually configure the NZ_QUERY_HISTORY table as you might have been doing with your Netezza system. The Yellowbrick system provides a richer, more granular level of detail about all activity within the database and is easy to configure. You can set the retention period for your history with just one click.

Determining the current Netezza DDL
The nz_ddl_database command provides all the information about the DDL in your Netezza system, including table, view, synonym, and sequence definitions; user and group role creations; stored procedures; user-defined functions; and much more.

To extract the DDL for each database, execute the following command:

```
$ nz_ddl_database <database> > <database>.ddl
```

Your Yellowbrick solutions architect will perform an inventory of your DDLs and map them appropriately to the Yellowbrick hybrid cloud data warehouse, according to best practices and using automated conversion tools.

Migrating table definitions
Migrating your table definitions is a seamless process. Many Yellowbrick customers move the Netezza DDL (CREATE TABLE) with absolutely no change to their data types. In addition, you will have the opportunity to improve your table distribution with the following options:

> Replication for all tables that compress to a gigabyte or less
> Hash-based co-location of all tables greater than a gigabyte on a distribution column that links all the tables
Randomly distributed tables for other use cases

The Yellowbrick hybrid cloud data warehouse also includes the following table features that enable you to further optimize your database:

- Table clustering and sorting that is like Netezza zone maps, but more granular
- Table partitioning, which is unavailable in Netezza; this feature reduces resource consumption for very large aggregates and supports fact-to-fact joins that are impossible to execute on a Netezza system

Migrating view definitions
Because the Yellowbrick system is based on PostgreSQL, all your valid SQL operations and database views will run as is.

Migrating stored procedures
The Yellowbrick hybrid cloud data warehouse supports PL/pgSQL stored procedures. Your Yellowbrick solutions architect will perform an impact analysis of your query history to determine which, if any, stored procedures you should migrate (that is, which stored procedures your queries are using).

Exporting the data
You export Latin as well as Unicode data from your Netezza system with one of these options:

- Direct streaming from Netezza into the Yellowbrick system (requires giving the Yellowbrick system permissions)
- Exporting Netezza data to CSV files. You can do this on a Windows or Linux client using the following methods:
  - `nz_backup`
  - `nzsql`
  - SQL for remote external tables
Data will export in ASCII-delimited format that can be compressed.

Importing the data
If you exported the data to a CSV file (as opposed to direct streaming), you will import it using the `ybload` tool. `ybload` is intuitive like Netezza `nzload`, but with dramatic improvements. It is designed for parallelization, so you will not need to chunk files manually, and it easily saturates the 10Gb network connection shipped with the Yellowbrick hybrid cloud data warehouse. `ybload` also compresses data before sending it to the Yellowbrick system and can load multiple files at once. For example, users can run one `ybload` with a thousand files as input instead of invoking `nzload` a thousand separate times. These optimizations make loading simple and dramatically accelerate load speeds compared to Netezza.

Yellowbrick systems can also load data directly from cloud-based object storage that’s S3-compatible. The system supports compressed or uncompressed files. If you are an HDFS user storing data in Hadoop, the Yellowbrick hybrid cloud data warehouse uses a Spark-based importer that can consume most common Hadoop file formats, such as Apache Parquet or Avro.

Migrating user-defined functions (UDFs)
Netezza systems often have an Oracle compatibility toolkit installed that provides a set of UDFs. Typically customers use only a small number of UDFs, and the Yellowbrick hybrid cloud data warehouse includes many of these functions out of the box. Your Yellowbrick solutions architect will perform an impact analysis to see if there are any functions the Yellowbrick system does not provide that are being used by queries.

Users, groups, and security configuration
Like Netezza, the Yellowbrick hybrid cloud data warehouse supports local or LDAP authentication methods.

Creating database users (or roles) is the primary mechanism for managing local database security. After creating users, you can set up access control by granting or revoking privileges on databases, schemas, tables, columns, and stored procedures.
Use the following SQL commands: CREATE ROLE, GRANT, and REVOKE.

Yellowbrick hybrid cloud data warehouse LDAP configurations support directory service providers such as Active Directory (AD) for OpenLDAP, LDAP, LDAPS (LDAP over SSL), and LDAP+TLS configurations. This is an improvement over Netezza LDAP integration, which is limited to just authentication and requires Netezza customers to manually create USERS or GROUPS and can result in mismatches to the LDAP service.

The Yellowbrick system provides an alternative to creating non-superusers manually in the database by synchronizing the users and groups stored in an LDAP directory and creates users and roles with the same credentials. You can synchronize specific users and groups by defining search criteria and filters.

Redirecting users and applications
You can connect ODBC, JDBC, and ADO.NET applications to a Yellowbrick database using standard PostgreSQL drivers you download and install. This means you do not have to purchase new licenses to redirect your existing applications. More importantly, third-party tools (such as BI, ETL, and analytical tools) that are certified for PostgreSQL drivers will automatically be certified for the Yellowbrick hybrid cloud data warehouse.

Yellowbrick ships the open-standard PostgreSQL versions of these Windows or Linux drivers with every system. ETL tools leverage ybload and ybunload for high-speed data movement in and out of the Yellowbrick system as described in the “Importing the data” section on page 5.

Simplify operations with intelligent automation
As easy as it is to migrate to a Yellowbrick hybrid cloud data warehouse, the biggest impact the system will have on your organization is after the migration completes. The Yellowbrick hybrid cloud data warehouse automates most mundane maintenance tasks so you can free your nights and weekends and finally tackle the projects you’ve always wanted to.

Automate smart workload management
The Yellowbrick hybrid cloud data warehouse is designed to deliver high performance to mixed workloads that modern enterprises require. It can support thousands of concurrent users running mixtures of real-time transactional atomic inserts; bulk loads of data; ELT workloads; interactive queries; ad hoc queries; and long-running, batch-oriented reports. While today’s mixed workloads require a high-performance solution, as the number and diversity of workloads increases, it is even more critical that you have the ability to specify, control, and automate the work that matters most. The Yellowbrick system gives you this with:

> Real-time visibility into workload performance, with alerts, that ensures you know immediately when workloads are struggling. Historical workload reporting also helps you manage workloads effectively across the enterprise.

> Workload management reporting that enables you to see if the performance of different workload groups is meeting business requirements.

> The ability to reprioritize any workload on the fly so you can adapt to unexpected changes in the business environment.

Automating workload management in a Yellowbrick hybrid cloud data warehouse is simple and can be done via the Yellowbrick web interface or SQL ALTER commands.

Automate system monitoring
The Yellowbrick hybrid cloud data warehouse includes 24x7 predictive remote monitoring technology that enables Yellowbrick support engineers to handle day-to-day monitoring activities. Yellowbrick support engineers review real-time diagnostic data, provide recommen-
dations, proactively address potential issues, and deliver prompt incident resolution.

You can monitor the system yourself, instead of or in addition to using the Yellowbrick service. You can do this through automated alerts that easily integrate to the endpoint tool of your choice. This is a welcome relief from manually configuring each nzevent you want to monitor.

Increase visibility
System views give you comprehensive, real-time visibility into the Yellowbrick system. Monitoring is performed continuously without affecting system performance and is thoroughly documented so you can find what you need, when you need it.

Summary
Migrating from Netezza to a Yellowbrick hybrid cloud data warehouse is fast and painless. In days or weeks you can have a running system that is intuitive like your Netezza system and largely compatible. Better still, your Yellowbrick system will be faster, easier to manage, and incrementally scalable.
